The Parts of Speech

Parts of speech (POS) are classes that correspond to lexical (or word) categories.

Plato distinguished between the verb and the noun.

After him, the inventory of word categories continued to evolve and expand until Dionysius Thrax formalized and stabilized it.

Aelius Donatus later popularized the list of the eight classical parts of speech: noun, pronoun, verb, participle, conjunction, adverb, preposition, and interjection.

Grammarians have adopted these categories for most European languages, even though the classification remains somewhat arbitrary.

Parts of speech fall into two main classes: the open class and the closed class.

Parts of Speech: Open-Class Words

POS	English	French	German
Nouns	<i>name, Frank</i>	<i>nom, François</i>	<i>Name, Franz</i>
Adjectives	<i>big, good</i>	<i>grand, bon</i>	<i>groß, gut</i>
Verbs	<i>to swim</i>	<i>nager</i>	<i>schwimmen</i>
Adverbs	<i>rather, very, only</i>	<i>plutôt, très, uniquement</i>	<i>fast, nur, sehr, endlich</i>

Parts of Speech: Closed-Class Words

POS	English	French	German
Determiners	<i>the, several, my</i>	<i>le, plusieurs, mon</i>	<i>der, mehrere, mein</i>
Pronouns	<i>he, she, it</i>	<i>il, elle, lui</i>	<i>er, sie, ihm</i>
Prepositions	<i>to, of</i>	<i>vers, de</i>	<i>nach, von</i>
Conjunctions	<i>and, or</i>	<i>et, ou</i>	<i>und, oder</i>
Auxiliaries and modals	<i>be, have, will, would</i>	<i>être, avoir, pouvoir</i>	<i>sein, haben, können</i>

Annotation with Parts of Speech

Sentence:

That round table might collapse

Annotation:

Word	Part of speech	POS tag
<i>that</i>	Determiner	DET
<i>round</i>	Adjective	ADJ
<i>table</i>	Noun	NOUN
<i>might</i>	Modal verb	AUX
<i>collapse</i>	Verb	VERB

Automatic annotation relies on predefined POS tagsets, such as the Penn Treebank tagset for English.

Training Sets: The CoNLL Format

The CoNLL format is a tabular format used to distribute annotated texts. It was originally created for the shared tasks of the Conference on Natural Language Learning.

The precise annotation scheme has varied over the years; we use CoNLL-U, the most recent version.

Annotation of the Spanish sentence:

La reestructuración de los otros bancos checos se está acompañando por la reducción del personal

'The restructuring of the other Czech banks is being accompanied by a reduction in staff'

Example of Annotation (CoNLL-U)

La reestructuración de los otros bancos checos se está acompañando por la reducción del personal

ID	FORM	LEMMA	UPOS	FEATS
1	La	el	DET	Definite=Def Gender=Fem Number=Sing PronType=Art

Ambiguity

Word	Possible tags	Example of use
<i>that</i>	Subordinating conjunction Determiner Adverb Pronoun Relative pronoun	<i>That he can swim is good</i> <i>That white table</i> <i>It is not that easy</i> <i>That is the table</i> <i>The table that collapsed</i>
<i>round</i>	Verb Preposition Noun Adjective Adverb	<i>Round up the usual suspects</i> <i>Turn round the corner</i> <i>A big round</i> <i>A round box</i> <i>He went round</i>
<i>table</i>	Noun Verb	<i>That white table</i> <i>I table that</i>
<i>might</i>	Noun Modal verb	<i>The might of the wind</i> <i>She might come</i>
<i>collapse</i>	Noun Verb	<i>The collapse of the empire</i> <i>The empire can collapse</i>

Part-of-Speech Ambiguity in Swedish

The word *som* in the *Norstedts svenska ordbok* (1999) has three entries:

- ① *Om jag vore lika vacker som du, skulle jag vara lycklig.* (conjunction)
- ② *Bilen som jag köpte i fjol.* (pronoun)
- ③ *Som jag har saknat dig.* (adverb)

The part-of-speech distinction can be significant:

Swedish. Compare the pronunciation of *vaken* (adjective) in *Han är aldrig vaken innan klockan sju* with *vaken* (noun) in *Vi fiskade i vaken i sjön.*

English. Compare *object* in *I object to violence* (verb) with *I could see an object* (noun).

Grammatical Features

Main parts of speech	Features (subcategories)
----------------------	--------------------------

Adjective, noun, pronoun	Regular, base, comparative, superlative, interrogative, person, number, case
--------------------------	--

Adverb	Regular, base, comparative, superlative, interrogative
--------	--

Article, determiner, preposition	Person, case, number
----------------------------------	----------------------

Verb	Tense, voice, mood, person, number, case
------	--

← Parsing

Language Differences (Source: Xerox)

Language	# stems	# inflected forms	Lex. size (kb)
English	55,000	240,000	200–300
French	50,000	5,700,000	200–300
German	50,000	350,000 or infinite (compounding)	450
Japanese	130,000	200 suffixes	500
		20,000,000 word forms	500
Spanish	40,000	3,000,000	200–300

Two-Level Morphology

Modern morphological parsers are based on the two-level model of Kimmo Koskenniemi (1983).

The model relates the surface form of a word (the form that appears in a text) to its lexical (or underlying) form (its sequence of morphemes):

Surface:	disentangled
Lexical (or underlying):	dis+en+tangle+ed

Examples

Generation: Lexical to surface form →

English	<i>dis+en+tangle+ed</i>	<i>disentangled</i>
	<i>happy+er</i>	<i>happier</i>
	<i>move+ed</i>	<i>moved</i>
French	<i>dés+em+brouiller+é</i>	<i>désembrouillé</i>
	<i>dé+chanter+erons</i>	<i>déchanterons</i>
German	<i>ent+wirren+end</i>	<i>entwirrend</i>
	<i>wieder+ge+schreiben+en</i>	<i>wiedergeschrieben</i>

Parsing: ← Surface to lexical form

Aligning the Two Forms

English	dis+en+tangle+ed ⇕ ... dis0en0tangl00ed	happy+er ⇕ ... happi0er	move+ed ⇕ ... mov00ed
French	dé+chanter+erons ⇕ ... dé0chant000erons	cheval+ux ⇕ ... cheva00ux	cheviller+é ⇕ ... chevill000é
German	singen+st ⇕ ... sing00st	Grund+`e ⇕ ... Gründ00e	Igel+Ø ⇕ ... Igel00

Interpreting the Morphemes

Suffixes carry grammatical information: the French ending *erons*, for example, encodes verb + future + first person + plural.

Morphological parsers can therefore represent the lexical form as a concatenation of the stem and its grammatical features rather than the stem and the surface suffix.

The Xerox parser produces the following analyses for *disentangled* and *happier*:

disentangle+Verb+PastBoth+123SP

happy+Adj+Comp

where +Verb marks a verb, +PastBoth indicates either past tense or past participle, and +123SP stands for any person, singular or plural; +Adj marks an adjective and +Comp a comparative.

Aligning Morphemes and Features

Lexical:	d	i	s	e	n	t	a	n	g	l	e	+Verb	+PastBoth	+123sp
	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑	↑
Surface:	d	i	s	e	n	t	a	n	g	l	0	0	e	d

Lexical:	h	a	p	p	y	+Adj	+Comp
	↑	↑	↑	↑	↑	↑	↑
Surface:	h	a	p	p	i	e	r

Transducers

The string *abbbc* is transduced into *zyyyx*.

Mathematical Definition of a Finite-State Transducer

- 1 Q is a finite set of states.
- 2 Σ is a finite set of symbol pairs $i : o$, where i belongs to the input alphabet and o to the output alphabet. Both alphabets may include the empty symbol ε .
- 3 q_0 is the start state ($q_0 \in Q$).
- 4 F is the set of final states ($F \subseteq Q$).
- 5 δ is the transition function $Q \times \Sigma \rightarrow Q$, where $\delta(q, i : o)$ returns the state reached from q on the input–output pair $i : o$.

For the example transducer we have $Q = \{q_0, q_1, q_2\}$,

$\Sigma = \{a : z, b : y, c : x\}$,

$\delta = \{\delta(q_0, a : z) = q_1, \delta(q_1, b : y) = q_1, \delta(q_1, c : x) = q_2\}$, and $F = \{q_2\}$.

French Verb Transducers for *chanter*

Number\Person	First	Second	Third
singular	<i>chanterai</i>	<i>chanteras</i>	<i>chantera</i>
plural	<i>chanterons</i>	<i>chanterez</i>	<i>chanteront</i>

Number\Pers.	First	Second	Third
singular	chanter+erai	chanter+eras	chanter+era
	chant000erai	chant000eras	chant000era
plural	chanter+erons	chanter+erez	chanter+eront
	chant000erons	chant000erez	chant000eront

Transducer for *chanter*

French Verb Transducers: Future, First Group

Such transducers can be implemented in Prolog or with OpenFst (<https://www.openfst.org/>).

Romance Languages

Language	Number\Person	First	Second	Third
Italian				
	singular	<i>canterò</i>	<i>canterai</i>	<i>canterà</i>
	plural	<i>canteremo</i>	<i>canterete</i>	<i>canteranno</i>
Spanish				
	singular	<i>cantaré</i>	<i>cantarás</i>	<i>cantará</i>
	plural	<i>cantaremos</i>	<i>cantaréis</i>	<i>cantarán</i>
Portuguese				
	singular	<i>cantarei</i>	<i>cantarás</i>	<i>cantará</i>
	plural	<i>cantaremos</i>	<i>cantareis</i>	<i>cantarão</i>

Course Content: Optional Part

Starting in 2023, the remaining slides in this document are no longer part of the course.

You may nevertheless read them if you are curious.

Ambiguity

In the future-tense transducer there is no ambiguity: each surface form corresponds to a unique lexical form and a unique final state.

This is not the case for the present tense:

(je) *chante* 'I sing'

(il) *chante* 'he sings'

Number\Person	First	Second	Third
singular	<i>chante</i>	<i>chantes</i>	<i>chante</i>
plural	<i>chantons</i>	<i>chantez</i>	<i>chantent</i>

Transducer Ambiguity

Final states 5 and 7 coincide.

A Prolog implementation is analogous to that of the future tense.

By backtracking, the transducer can return all final states and thereby expose the morphological ambiguity.

Koskenniemi's Rules

Koskenniemi described morphology with declarative rules that refer to left and right contexts and employ the operators $\Rightarrow$, $\Leftarrow$, $\Leftrightarrow$, or $/ \Leftarrow$.

In English a lexical *y* may correspond to a surface *i*, as in *happier*.

This happens when *y* is preceded by a consonant and followed by *-er*, *-ed* or *-s*:

- ① $y:i \Leftarrow C:C _ _ +:0 \ e:e \ r:r$
- ② $y:i \Leftarrow C:C _ _ +:e \ s:s$
- ③ $y:i \Leftarrow C:C _ _ +:0 \ e:e \ d:d$

Two-Level Rules

Lexical-to-surface transduction is expressed by rules of the following kinds:

Rules	Description
$a:b \Rightarrow lc _ rc$	a is realized as b only in the context $lc _ rc$
$a:b \Leftarrow lc _ rc$	a is always realized as b in the context $lc _ rc$
$a:b \Leftrightarrow lc _ rc$	a is realized as b always and only in the context $lc _ rc$
$a:b / \Leftarrow lc _ rc$	a is never realized as b in the context $lc _ rc$

Parallel Rules

All applicable rules are applied in parallel (provided their contexts match).

Rules and Transducers

Each rule can be compiled into an equivalent finite-state transducer.

Rule Intersection

The parallel transducers are subsequently combined into a single transducer by intersection.

Problems with Intersection

The intersection of two finite-state automata is always a finite-state automaton.

This is not always true for finite-state transducers.

Kaplan and Kay (1994) showed that when the surface and lexical strings have the same length (no ϵ -transitions), the intersection is itself a transducer.

This property is sufficient for practical rule intersection.

In practice, transducers derived from two-level rules are intersected by treating the ϵ symbol as an ordinary symbol (Beesley & Karttunen 2003, p. 55).

Xerox

Originally the rules were compiled by hand.

This quickly becomes intractable when rules conflict or when rule contexts interact with the symbols being transduced.

The problem is solved by a compiler that automatically constructs transducers from two-level rules.

Xerox's XFST is a publicly available tool and, to date, the only robust implementation of a morphological rule compiler.

Morphology of French Verbs

We have so far used a stem together with a set of suffixes for regular French verbs.

Irregular French verbs are considerably more complex.

Chanod (1994) provides an example of their decomposition into simple rules.

Infinitive	courir	dormir	battre	peindre	écrire
1st sg.	cours <u>s</u>	dors	bats	peins	écris
2nd sg.	cours <u>s</u>	dors	bats	peins	écris
3rd sg.	court <u>t</u>	dort	bat	peint	écrit
1st pl.	cour <u>ons</u>	dormons	battons	peignons	écrivons
2nd pl.	cour <u>ez</u>	dormez	battez	peignez	écrivez
3rd pl.	cour <u>ent</u>	dorment	battent	peignent	écrivent

French Morphology

Lexical form: stem	dormir	+IndP	+SG	+P1
	↕		↕	
Intermediate form: inflection	dorm	+IndP	+SG	+P1
	↕		↕	
Intermediate form: deletion of <i>m</i> before <i>s</i>	dorm		s	
	↕		↕	
Surface form:	dor		s	

From *peindre* to *peins*:

$n:0 \Leftrightarrow g _ [s|t]$

Composition and Intersection
